

## Higher product availability and lower maintenance costs with smart maintenance of your product

24 October 2023, 14:01

Pieter Beyl

Providing a product with smart maintenance is one of the common smart product strategies that product companies are able to pursue thanks to digital technology. In this blog you will learn about the key drivers and benefits of adding **smart maintenance** to your products, illustrated with several product examples of local companies.

Sirris has analysed over 150 smart products and condensed them in a selection of 17 different smart product scenarios. These scenarios differ in their smart capability, business strategy, customer value, business value and key enabling technologies. In this blog series, we guide you through the 5 most common smart product scenarios.

### Facilitation of supporting processes of the product

The product is able to aid in provisioning, commissioning or maintenance of the product itself or the system it is part of, thanks to automated processing and exchange of data of the operation of the

product. The key enabling technologies are secure and dependable connectivity, local decision making in the product, dedicated sensing of the health state of the product and cloud for centralised asset management.

Some inspiring examples:

- **ABN Clean Room Technology** follows a smart maintenance and service approach that optimises operations over the life cycle and extends the lifetime of the cleanroom. Through a cloud based platform cleanrooms can be monitored 24/7, from any location.. [More about this case](#)
- **Hannecard's** roller-as-a-service offering includes the roller monitoring and management solution 'countroll', which allows customers to optimise their roller operations, anticipate on maintenance interventions and achieve higher roller performance. [More about this case.](#)
- **Shayp's** water management solution makes it possible to monitor consumption, detect leaks and track maintenance interventions remotely thanks to connected data loggers and cloud-based management software. [More about this case](#)
- **Pattyn's** cloud-based solution centralises and stores all machine status information for its customers in food packaging. The access to historical machine data and the ability to deliver remote technical support allows Pattyn to resolve remaining issues more quickly. [More about this case](#)
- **Stüv's** remotely monitored and controlled pellet stove notifies the user of the various alarms relating to the operation of the stove, and is able to share data with the dealer and Stüv, so that remote support can be provided. [More about this case.](#)
- The **Will-Fill** is an add-on device with a built-in control unit that automatically adjusts and remotely monitors the condition of the cutting fluid of metalworking machines, reducing manual maintenance efforts. [More about this case](#)

## Higher product availability with less effort

Because the deployment, configuration, maintenance or repair of a product are done better, faster and more efficiently, based on operational data from the connected product, the main economic value element for the customer is the return from a higher product availability and reduced maintenance costs. The supporting processes are accelerated and become more resource-efficient and of a higher quality. They ensure a better performance of the product, simplify the operations at the customer's and reduce the customer's effort to keep the product operational.

## Recurring revenue and lower servicing costs with total customer solutions

Smart maintenance aims for a broader offering and a more total customer solution, beyond the functionality of the product, allowing the product builder to shift from a pure product transfer to product-related services that replace or complement existing services around the product. This contributes to increased revenue, reduced servicing costs, more streamlined after-sales services, a closer customer contact and more direct insights in product usage and customer needs.
